

Seat people ethically

More attributes to consider:

- Size of person (maybe taller people do get options to get more appropriate seats for their sizes and not base it on who pays more)
- In a family/bought tickets together
- People who want more privacy (breastfeeding women)

A simple algorithm I would think of:

- Break groups of families bought together into groups of 3(or 2 depending on how many seats are on one side of the aisle.)
- Seat these families together so the broken groups would be in different rows but on the same side of the aisle
- Repeat this (start from the largest group down to the smallest family group)
- Seat people with transfer flights next and closer to the front
- Seat people who are tall and self-identify as tall and needing extra room into seats that are available and bigger
- Seat breastfeeding mothers near windows for more privacy (that is what I would prefer, but not sure if others would – so just a guess)
- Seat people in order of what they paid for (people who paid more maybe get window seats or aisle seats and then let it fill into left over seats)
